| 95 | <p>Hippokratia. 2011 Jul;15(3):265-8. White Matter Lesions in Femoral Head Osteonecrosis patients: Manifestation of vascular disease or not? Dimitroulias A, Tsironi E, Hadjigeorgiou G, Scarneas N, Rountas Ch, Zibis A, Malizos K. Abstract Background: Osteonecrosis has been associated with the presence of white matter lesions. The objective of this study was to investigate the association between macro- and micro- vascular disease and white matter lesions. Methods: Sixty-four patients with femoral head osteonecrosis were assessed during a cross sectional study in our university-based hospital. A vascular 'profile' was obtained for each patient and included measurement of plasma lipids, fundoscopic examination and common carotid artery triplex ultrasonography. All patients had brain MRI to assess for presence of white matter lesions. The two groups formed, with and without white matter lesions, were compared in order to define the association between white matter lesions and vascular disease. Results: Patients without white matter lesions had more frequently corticosteroid induced osteonecrosis. There was no difference in the two groups with respect to intima media thickness and ApoB/ApoA1 ratio. Only one of our patients demonstrated retinopathy. Conclusions: There is no evidence of concurrent macro- and micro- vascular pathology in young patients with white matter lesions and femoral head osteonecrosis. Cortisone appears to have a 'protective' effect against occurrence of white matter lesions.</p> |
| 96 | <p><i>BMC Ear Nose Throat Disord.</i> 2011 May 25;11:5. doi: 10.1186/1472-6815-11-5. Signs and symptoms of temporomandibular joint disorders related to the degree of mouth opening and hearing loss. Kitsoulis P, Marini A, Iliou K, Galani V, Zimpis A, Kanavaros P, Paraskevas G. Source Orthopaedic Surgeon, Professor of Anatomy-Histology-Embryology, Medical School, University of Ioannina, Greece. pkitsoulis@hotmail.com. Abstract BACKGROUND: The temporomandibular joint is a unique bi-condylar joint involved in mastication and speech. Temporomandibular joint disorders (TMD) have a range of symptoms, including aural symptoms, and are present in approximately 75% of normal populations. The present study examined the relationship between signs and symptoms of TMD and mouth opening, gender, joint and aural symptoms, and hearing loss. METHODS: The study involved 464 healthy Greek university students (156 men and 308 women) with a mean age of 19.6 years. Age, gender and maximum mouth opening was recorded. Mouth opening was measured using Vernier calipers. An anamnestic questionnaire was used to stratify the subjects into four groups based on TMD severity. Aural symptoms and an audiogram were recorded for each subject too. Data were analyzed using multifactor ANOVA, chi-square, t-test, Mann-Whitney and Kruskal-Wallis tests. RESULTS:</p> |

| | |
|-----|--|
| | <p>The overall incidence of TMD signs and symptoms was 73.3%. The incidence and severity was greater in females than males (p-value 0.0001 < 0.05). The number of aural symptoms was associated to the TMD severity (p-value 0.0001 < 0.05) as well as maximum mouth opening (p-value 0.004 < 0.05). Audiometry showed that moderate and severe TMD was associated with hearing loss of median and low tones respectively (p-value 0.0001 < 0.05). TMJ pain (p-value 0.0001 < 0.05), TMJ ankylosis (p-value 0.0001 < 0.05), bruxism (p-value 0.0001 < 0.05) and ear itching (p-value 0.0001 < 0.05) were also found to be statistically different between TMD and non-TMD subjects. CONCLUSIONS: TMD signs and symptoms were more common and severe in females than males. TMD severity is correlated with the degree of mouth opening and the number of aural symptoms. The absence or presence of mild TMD are associated with normal audiograms while moderate and severe TMD are related to hearing loss in median and low tones respectively. Bruxism, joint ankylosis, joint pain and ear itching were more common in TMD than non-TMD patients.</p> |

| 193 | <p>1. Zibis AH, Giannis D, Malizos KN, Kitsioulis P, Arvanitis DL. Acute calcific tendinitis of the longus colli muscle: case report and review of the literature. <i>Eur Spine J.</i> 2012 Nov 21 Department of Anatomy, Medical School, University of Thessalia, (IF= 1,965) citations 8 PURPOSE: Acute calcific tendinitis of the longus colli muscle (or retropharyngeal tendinitis) is an aseptic inflammatory process characterized by acute posterior neck pain, neck stiffness and dysphagia or odynophagia. Awareness of its existence is crucial in the differential diagnosis, because many other conditions, such as retropharyngeal abscess, meningitis or disc herniation, show similar clinical features. We present a case exhibiting an uncommon symptom (torticollis) and a brief literature review to emphasize the risk of misdiagnosis. METHODS: A 36-year-old woman presented with neck stiffness and torticollis accompanied by dysphagia and prevertebral space sensitivity on the second day. RESULTS: The diagnosis was established by computed tomography (CT), the gold standard for identifying the presence of prevertebral oedema and calcific deposition associated with retropharyngeal tendinitis. Treatment with NSAIDs and low doses of corticosteroids relieved the symptoms within 48 h. CONCLUSIONS: Retropharyngeal tendinitis is an underreported entity in the literature and orthopaedists should become aware of its existence. Misdiagnosis of this important mimicker may lead to unnecessary antibiotics administration and interventions in the retropharyngeal space.</p> |
